

The Value of Vision

God has given certain creatures amazing capabilities. The chameleon, for example, shows uncanny accuracy in nabbing bugs with its tongue. Scientists have discovered why. Chameleons have telephoto eyes.

Don't believe it? Well, according to Matthias Ott and Frank Schaeffel of the University Eye Hospital in Tübingen, Germany, the lizards have eyes that work like the telephoto lens on a camera. That requires a positive and negative lens. All other animals in the world have only a positive, convex lens. This is the first discovery of a creature that also has a negative, concave lens. The two lenses give the chameleon super vision.

God – not evolution – was in charge of that special work.

Being able to see in ways that others do not often makes the difference between success and failure. It's certainly true in the world of business. Entrepreneurs are generally individuals who can see beyond the present to the fulfillment of a goal or dream, and develop the strategy to achieve it.

Life Care Centers of America is the product of the vision of its founder, Forrest L. Preston, to provide excellent service to those entrusted to us. It is a vision that is being fulfilled every day by the associates who are committed to the mission of caring for God's children, our residents.

It's no wonder that Proverbs 29:18 says: "Where there is no vision, the people perish."
